Animal Health in the Home

Did you know animal health benefits your day to day life?

The animal health sector provides value to society by protecting the health and welfare of animals. We also play a role in protecting public health by bringing safer, more secure and sustainable food supplies, and by preventing the transmission of zoonotic diseases (i.e. transmissible between animals and people).

We welcome pets in our homes thanks to vaccines and anti-parasitics that protect them against ticks, fleas, worms and otherwise fatal diseases such as Feline Leukaemia virus (FeLV), the leading viral killer of cats, with 80-90% of infected cats dying within 3-4 years.

70,000 people are killed each year worldwide due to rabies; 20,000 in India alone. Vaccinating 70% of the dog population has shown to protect people from rabies.

$294 bln is the estimated annual global value of bees’ pollination work which produces honey, and the wax used in cleaning products. Innovations in animal health technologies help protect bee populations.

Global aquaculture production has increased by over 1000% these last 3 decades. Veterinary intervention and responsible aquaculture support coastal communities to provide a sustainable protein source.

By 2016, Brazil will become the second largest pet care market in the world, overtaking Japan. The largest market is the United States.

$218 mln tonnes in 2000, global meat production is projected to increase to 376 mln tonnes by 2030 - Innovations in animal health help towards greater animal welfare, increased food security and food safety. Happy and healthy animals are also naturally more productive.
